Chapter 11- C++ Stream Input/Output

Outline

11.1 Introduction

- Many C++ I/O features are object-oriented
  - use references, function overloading and operator overloading
- C++ uses type safe I/O
  - Each I/O operation is automatically performed in a manner sensitive to the data type
- Extensibility
  - Users may specify I/O of user-defined types as well as standard types

11.2 Streams

- Stream
  - A transfer of information in the form of a sequence of bytes

- I/O Operations:
  - Input: A stream that flows from an input device (i.e.: keyboard, disk drive, network connection) to main memory
  - Output: A stream that flows from main memory to an output device (i.e.: screen, printer, disk drive, network connection)

11.2 Streams (II)

- I/O operations are a bottleneck
  - The time for a stream to flow is many times larger than the time it takes the CPU to process the data in the stream
- Low-level I/O
  - unformatted
  - individual byte unit of interest
  - high speed, high volume, but inconvenient for people
- High-level I/O
  - formatted
  - bytes grouped into meaningful units: integers, characters, etc.
  - good for all I/O except high-volume file processing

11.2.1 Iostream Library Header Files

- **`iostream`** library:
  - **`<iostream.h>:`** Contains **`cin`**, **`cout`**, **`cerr`**, and **`clog`** objects
  - **`<iomanip.h>:`** Contains *parameterized stream manipulators*
  - **`<fstream.h>:`** Contains information important to user-controlled file processing operations

11.2.2 Stream Input/Output Classes and Objects

- **`ios`:**
  - **`istream`** and **`ostream`** inherit from **`ios`**
    - **`iostream`** inherits from **`istream`** and **`ostream`**.
- **`<<`** (left-shift operator): overloaded as *stream insertion operator*
- **`>>`** (right-shift operator): overloaded as *stream extraction operator*
- Used with **`cin`**, **`cout`**, **`cerr`**, **`clog`**, and with user-defined stream objects

11.2.2 Stream Input/Output Classes and Objects (II)

- **`istream:`** input streams
  - **`cin >> someVariable`**;
    - **`cin`** knows what type of data is to be assigned to **`someVariable`** (based on the type of **`someVariable`**).
- **`ostream:`** output streams
  - **`cout << someVariable;`**
    - **`cout`** knows the type of data to output
  - **`cerr << someString;`**
    - Unbuffered. Prints **`someString`** immediately.
  - **`clog << someString;`**
    - Buffered. Prints **`someString`** as soon as output buffer is full or flushed.

11.3 Stream Output

- **`ostream`**: performs formatted and unformatted output
  - Uses **`put`** for characters and **`write`** for unformatted characters
  - Output of numbers in decimal, octal and hexadecimal
  - Varying precision for floating points
  - Formatted text outputs

11.3.1 Stream-Insertion Operator

- **<<** is overloaded to output built-in types
  - can also be used to output user-defined types.
  - **cout << '\n';**
    - prints newline character
  - **cout << endl;**
    - **endl** is a stream manipulator that issues a newline character and flushes the output buffer
  - **cout << flush;**
    - **flush** flushes the output buffer.

11.3.2 Cascading Stream-Insertion/Extraction Operators

- **<<** : Associates from left to right, and returns a reference to its left-operand object (i.e. **cout**).
  - This enables cascading

```
cout << "How" << " are" << " you?";
```

Make sure to use parenthesis:

```
cout << "1 + 2 = " << (1 + 2);
```

NOT

```
cout << "1 + 2 = " << 1 + 2;
```

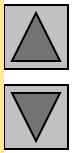
11.3.3 Output of `char *` Variables

- **`<<`** will output a variable of type **`char *`** as a string

- To output the address of the first character of that string, cast the variable as type **`void *`**

```
1  // Fig. 11.8: fig11_08.cpp
2  // Printing the address stored in a char* variable
3  #include <iostream>
4
5  using std::cout;
6  using std::endl;
7
8  int main()
9  {
10    char *string = "test";
11
12    cout << "Value of string is: " << string
13         << "\nValue of static_cast< void * >( string ) is: "
14         << static_cast< void * >( string ) << endl;
15    return 0;
16 }
```

```
Value of string is: test
Value of static_cast< void *>( string ) is: 0046C070
```



Outline

1. Initialize string

2. Print string

2.1 cast into void *

2.2 Print value of pointer (address of string)

Program Output

11.3.4 Character Output with Member Function put; Cascading puts

- **`put`** member function
  - outputs one character to specified stream

    ```
    cout.put( 'A');
    ```
  - returns a reference to the object that called it, so may be cascaded

    ```
    cout.put( 'A' ).put( '\n' );
    ```
  - may be called with an ASCII-valued expression

    ```
    cout.put(65);
    ```

    outputs **`A`**

11.4 Stream Input

- **`>>`** (stream-extraction)
  - used to perform stream input
  - Normally ignores whitespaces (spaces, tabs, newlines)
  - Returns zero (**`false`**) when **`EOF`** is encountered, otherwise returns reference to the object from which it was invoked (i.e. **`cin`**)
    - This enables cascaded input.

```
cin >> x >> y;
```

- **`>>`** controls the state bits of the stream
  - **`failbit`** set if wrong type of data input
  - **`badbit`** set if the operation fails

11.4.1 Stream-Extraction Operator

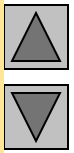
- **>>** and **<<** have relatively high precedence
  - conditional and arithmetic expressions must be contained in parentheses

- Popular way to perform loops

```
while (cin >> grade)
```

  - extraction returns **0** (**false**) when **EOF** encountered, and loop ends

```
1  // Fig. 11.11: fig11_11.cpp
2  // Stream-extraction operator returning false on end-of-file.
3  #include <iostream>
4
5  using std::cout;
6  using std::cin;
7  using std::endl;
8
9  int main()
10 {
11    int grade, highestGrade = -1;
12
13    cout << "Enter grade (enter end-of-file to end): ";
14    while ( cin >> grade ) {
15       if ( grade > highestGrade )
16          highestGrade = grade;
17
18       cout << "Enter grade (enter end-of-file to end): ";
19    }
20
21    cout << "\n\nHighest grade is: " << highestGrade << endl;
22    return 0;
23 }
```



Outline

1. Initialize variables

2. Perform loop

3. Output

Program Output

```
Enter grade (enter end-of-file to end): 67
Enter grade (enter end-of-file to end): 87
Enter grade (enter end-of-file to end): 73
Enter grade (enter end-of-file to end): 95
Enter grade (enter end-of-file to end): 34
Enter grade (enter end-of-file to end): 99
Enter grade (enter end-of-file to end): ^Z
Highest grade is: 99
```

11.4.2 `get` and `getline` Member Functions

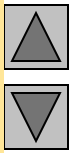
- **`cin.get()`:** inputs a character from stream (even white spaces) and returns it
- **`cin.get( c )`:** inputs a character from stream and stores it in **`c`**

11.4.2 `get` and `getline` Member Functions (II)

- **`cin.get(array, size)`:**
  - accepts 3 arguments: array of characters, the size limit, and a delimiter (default of **`'\n'`**).
  - Uses the array as a buffer
  - When the delimiter is encountered, it remains in the input stream
  - Null character is inserted in the array
  - unless delimiter flushed from stream, it will stay there

- **`cin.getline(array, size)`**
  - operates like **`cin.get(buffer, size)`** but it discards the delimiter from the stream and does not store it in array
  - Null character inserted into array

```
1  // Fig. 11.12: fig11_12.cpp
2  // Using member functions get, put and eof.
3  #include <iostream>
4
5  using std::cout;
6  using std::cin;
7  using std::endl;
8
9  int main()
10 {
11    char c;
12
13    cout << "Before input, cin.eof() is " << cin.eof()
14         << "\nEnter a sentence followed by end-of-file:\n";
15
16    while ( ( c = cin.get() ) != EOF )
17       cout.put( c );
18
19    cout << "\nEOF in this system is: " <<
20    cout << "\nAfter input, cin.eof() is " << cin.eof() << endl;
21    return 0;
22 }
```



Outline

1. Initialize variables

2. Input data

2.1 Function call

3. Output

`cin.eof()` returns **`false (0)`** or **`true (1)`**

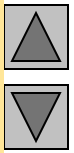
`cin.get()` returns the next character from input stream, including whitespace.

```
Before input, cin.eof() is 0
Enter a sentence followed by end-of-file:
Testing the get and put member functions^Z
Testing the get and put member functions
EOF in this system is: -1
After input cin.eof() is 1
```

```
1  // Fig. 11.14: fig11_14.cpp
2  // Character input with member function getline.
3  #include <iostream>
4
5  using std::cout;
6  using std::cin;
7  using std::endl;
8
9  int main()
10 {
11    const SIZE = 80;
12    char buffer[ SIZE ];
13
14    cout << "Enter a sentence:\n";
15    cin.getline( buffer, SIZE );
16
17    cout << "\nThe sentence entered is:\n" << buffer << endl;
18    return 0;
19 }
```

```
Enter a sentence:
Using the getline member function

The sentence entered is:
Using the getline member function
```



Outline

1. Initialize variables

2. Input

2.1 Function call

3. Output

Program Output

11.4.3 `istream` Member Functions `peek`, `putback` and `ignore`

- **`ignore`** member function
  - skips over a designated number of characters (default of one)
  - terminates upon encountering a designated delimiter (default is **`EOF`**, skips to the end of the file)
- **`putback`** member function
  - places the previous character obtained by **`get`** back in to the stream.
- **`peek`**
  - returns the next character from the stream without removing it

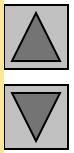
11.4.4 Type-Safe I/O

- **<<** and **>>** operators
  - Overloaded to accept data of different types
  - When unexpected data encountered, error flags set
  - Program stays in control

11.5 Unformatted I/O with `read`, `gcount` and `write`

- **`read`** and **`write`** member functions
  - unformatted I/O
  - input/output raw bytes to or from a character array in memory
  - Since the data is unformatted, the functions will not terminate at a **`newline`** character for example.
    - Instead, like **`getline`**, they continue to process a designated number of characters.
  - If fewer than the designated number of characters are read, then the failbit is set.
- **`gcount`**:
  - returns the total number of characters read in the last input operation.

```
1  // Fig. 11.15: fig11_15.cpp
2  // Unformatted I/O with read, gcount and write.
3  #include <iostream>
4
5  using std::cout;
6  using std::cin;
7  using std::endl;
8
9  int main()
10 {
11    const int SIZE = 80;
12    char buffer[ SIZE ];
13
14    cout << "Enter a sentence:\n";
15    cin.read( buffer, 20 );
16    cout << "\nThe sentence entered was:\n";
17    cout.write( buffer, cin.gcount() );
18    cout << endl;
19    return 0;
20 }
```



Outline

1. Initialize objects

2. Input

3. Output

Only reads first **20** characters

g.count() returns **20** because that was the number of characters read by the last input operation.

Program Output

```
Enter a sentence:
Using the read, write, and gcount member functions
The sentence entered was:
Using the read, writ
```

11.6 Stream Manipulators

- stream manipulator capabilities:
  - setting field widths
  - setting precisions
  - setting and unsetting format flags
  - setting the fill character in fields
  - flushing streams
  - inserting a newline in the output stream and flushing the stream inserting a null character in the output stream and skipping whitespace in the input stream.

11.6.1 Integral Stream Base: `dec`, `oct`, `hex` and `setbase`

- **`oct`, `hex`,** or **`dec`**:
  - change base of which integers are interpreted from the stream.

  Example:

```
int n = 15;
 cout << hex << n;
```

  - prints **`"F"`**

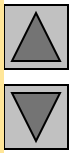
- **`setbase`**:
  - changes base of integer output
  - load **`<iomanip>`**
  - Accepts an integer argument (**`10`**, **`8`**, or **`16`**)

```
cout << setbase(16) << n;
```

  - parameterized stream manipulator - takes an argument

```
1  // Fig. 11.16: fig11_16.cpp
2  // Using hex, oct, dec and setbase stream manipulators.
3  #include <iostream>
4
5  using std::cout;
6  using std::cin;
7  using std::endl;
8
9  #include <iomanip>
10
11 using std::hex;
12 using std::dec;
13 using std::oct;
14 using std::setbase;
15
16 int main()
17 {
18    int n;
19
20    cout << "Enter a decimal number: ";
21    cin >> n;
22
23    cout << n << " in hexadecimal is: "
24         << hex << n << '\n'
25         << dec << n << " in octal is: "
26         << oct << n << '\n'
27         << setbase( 10 ) << n << " in decimal is: "
28         << n << endl;
29
30    return 0;
31 }
```

```
Enter a decimal number: 20
20 in hexadecimal is: 14
20 in octal is: 24
20 in decimal is: 20
```



Outline

1. Load header

1.1 Initialize variables

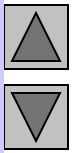
2. Input number

3. Output in hex

3.1 Output in octal

3.2 Output in decimal

```
Enter a decimal number: 20
20 in hexadecimal is: 14
20 in octal is: 24
20 in decimal is: 20
```



Outline

Program Output

11.6.2 Floating-Point Precision (`precision`, `setprecision`)

- **`precision`**
  - member function
  - sets number of digits to the right of decimal point
    ```
    cout.precision(2);
    ```
  - **`cout.precision()`** returns current precision setting
- **`setprecision`**
  - parameterized stream manipulator
  - Like all parameterized stream manipulators, **`<iomanip>`** required
  - specify precision:
    ```
    cout << setprecision(2) << x;
    ```
- For both methods, changes last until a different value is set

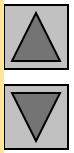
11.6.3 Field Width(`setw,width`)

- **`ios width`** member function
  - sets field width (number of character positions a value should be output or number of characters that should be input)
  - returns previous width
  - if values processed are smaller than width, fill characters inserted as padding
  - values are not truncated - full number printed
  - **`cin.width(5);`**
- **`setw`** stream manipulator

```
cin >> setw(5) >> string;
```

- Remember to reserve one space for the null character

```
1  // fig11_18.cpp
2  // Demonstrating the width member function
3  #include <iostream>
4
5  using std::cout;
6  using std::cin;
7  using std::endl;
8
9  int main()
10 {
11    int w = 4;
12    char string[ 10 ];
13
14    cout << "Enter a sentence:\n";
15    cin.width( 5 );
16
17    while ( cin >> string ) {
18       cout.width( w++ );
19       cout << string << endl;
20       cin.width( 5 );
21    }
22
23    return 0;
24 }
```



Outline

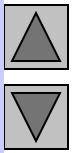
1. Initialize variables

2. Input sentence

2.1 Set width

2.2 Loop and change width

3. Output



Outline

Program Output

```
Enter a sentence:
This is a test of the width member function
This
   is
     a
   test
      of
      the
      widt
          h
        memb
           er
          func
           tion
```

11.6.4 User-Defined Manipulators

- We can create our own stream manipulators
  - **`bell`**
  - **`ret`** (carriage return)
  - **`tab`**
  - **`endLine`**

- parameterized stream manipulators
  - consult installation manuals

11.7 Stream Format States

- Format flags
  - specify formatting to be performed during stream I/O operations

- **`setf`**, **`unsetf`** and **`flags`**
  - member functions that control the flag settings

11.7.1 Format State Flags

- Format State Flags
  - defined as an enumeration in class **`ios`**
  - can be controlled by member functions
  - **`flags`** - specifies a value representing the settings of all the flags
    - returns **`long`** value containing prior options
  - **`setf`** - one argument, "ors" flags with existing flags
  - **`unsetf`** - unsets flags
  - **`setiosflags`** - parameterized stream manipulator used to set flags
  - **`resetiosflags`** - parameterized stream manipulator, has same functions as **`unsetf`**
- Flags can be combined using bitwise or "**|**"

11.7.2 Trailing Zeros and Decimal Points (`ios::showpoint`)

- **`ios::showpoint`**
  - forces a float with an integer value to be printed with its decimal point and trailing zeros

```
cout.setf(ios::showpoint)
cout << 79;
```

`79` will print as **`79.00000`**

- number of zeros determined by precision settings

11.7.3 Justification (`ios::left`, `ios::right`, `ios::internal`)

- **`ios::left`**
  - fields to left-justified with padding characters to the right
- **`ios::right`**
  - default setting
  - fields right-justified with padding characters to the left
- Character used for padding set by
  - **`fill`** member function
  - **`setfill`** parameterized stream manipulator
  - default character is space

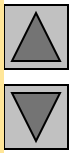
11.7.3 Justification (`ios::left`, `ios::right`, `ios::internal`) (II)

- **`internal`** flag
  - number's sign left-justified
  - number's magnitude right-justified
  - intervening spaces padded with the fill character

- **`static`** data member **`ios::adjustfield`**
  - contains **`left`**, **`right`** and **`internal`** flags
  - **`ios::adjustfield`** must be the second argument to **`setf`** when setting the **`left`**, **`right`** or **`internal`** justification flags.

```
cout.setf( ios::left, ios::adjustfield);
```

```
1  // Fig. 11.22: fig11_22.cpp
2  // Left-justification and right-justification.
3  #include <iostream>
4
5  using std::cout;
6  using std::endl;
7
8  #include <iomanip>
9
10 using std::ios;
11 using std::setw;
12 using std::setiosflags;
13 using std::resetiosflags;
14
15 int main()
16 {
17    int x = 12345;
18
19    cout << "Default is right justified:\n"
20         << setw(10) << x << "\n\nUSING MEMBER FUNCTIONS"
21         << "\nUse setf to set ios::left:\n" << setw(10);
22
23    cout.setf( ios::left, ios::adjustfield );
24    cout << x << "\nUse unsetf to restore default:\n";
25    cout.unsetf( ios::left );
26    cout << setw( 10 ) << x
27         << "\n\nUSING PARAMETERIZED STREAM MANIPULATORS"
28         << "\nUse setiosflags to set ios::left:\n"
29         << setw( 10 ) << setiosflags( ios::left ) << x
30         << "\nUse resetiosflags to restore default:\n"
31         << setw( 10 ) << resetiosflags( ios::left )
32         << x << endl;
33    return 0;
34 }
```



Outline

1. Initialize variable

2. Use parameterized stream manipulators

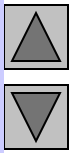
3. Output

```
Default is right justified:
     12345

USING MEMBER FUNCTIONS
Use setf to set ios::left:
12345

USING PARAMETERIZED STREAM MANIPULATORS
Use setiosflags to set ios::left:
12345

Use resetiosflags to restore default:
     12345
```



Outline

Program Output

```
Default is right justified:
     12345

USING MEMBER FUNCTIONS
Use setf to set ios::left:
12345
Use unsetf to restore default:
     12345

USING PARAMETERIZED STREAM MANIPULATORS
Use setiosflags to set ios::left:
12345
Use resetiosflags to restore default:
     12345
```

11.7.4 Padding(`fill`, `setfill`)

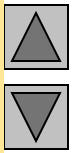
- **`fill`** member function
  - specifies the fill character
  - space is default
  - returns the prior padding character

```
cout.fill( '*');
```

- **`setfill`** manipulator
  - also sets fill character

```
cout << setfill ('*');
```

```
1  // Fig. 11.24: fig11_24.cpp
2  // Using the fill member function and the setfill
3  // manipulator to change the padding character for
4  // fields larger than the values being printed.
5  #include <iostream>
6
7  using std::cout;
8  using std::endl;
9
10 #include <iomanip>
11
12 using std::ios;
13 using std::setw;
14 using std::hex;
15 using std::dec;
16 using std::setfill;
17
18 int main()
19 {
20    int x = 10000;
```



Outline

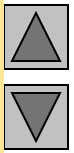
1. Load header

1.1 Initialize variable

```
21
22    cout << x << " printed as int right and left justified\n"
23         << "and as hex with internal justification.\n"
24         << "Using the default pad character (space):\n";
25    cout.setf( ios::showbase );
26    cout << setw( 10 ) << x << '\n';
27    cout.setf( ios::left, ios::adjustfield );
28    cout << setw( 10 ) << x << '\n';
29    cout.setf( ios::internal, ios::adjustfield );
30    cout << setw( 10 ) << hex << x;
31
32    cout << "\n\nUsing various padding characters:\n";
33    cout.setf( ios::right, ios::adjustfield );
34    cout.fill( '*' );
35    cout << setw( 10 ) << dec << x << '\n';
36    cout.setf( ios::left, ios::adjustfield );
37    cout << setw( 10 ) << setfill( '%' ) << x << '\n';
38    cout.setf( ios::internal, ios::adjustfield );
39    cout << setw( 10 ) << setfill( '^' ) << hex << x << endl;
40    return 0;
41 }
```

```
10000 printed as int right and left justified
and as hex with internal justification.
Using the default pad character (space):
     10000
10000
0x    2710

Using various padding characters:
*****10000
10000%%%%%
0x^^^^2710
```



Outline

2. Set fill character

3. Output

Program Output

11.7.5- Integral Stream Base (ios::dec, ios::oct, ios::hex, ios::showbase)

- **`ios::basefield`** static member
  - used similarly to **`ios::adjustfield`** with **`setf`**
  - includes the **`ios::oct`**, **`ios::hex`** and **`ios::dec`** flag bits
  - specify that integers are to be treated as octal, hexadecimal and decimal values
  - default is decimal
  - default for stream extractions depends on form inputted
    - integers starting with **`0`** are treated as octal
    - integers starting with **`0x`** or **`0X`** are treated as hexadecimal
  - once a base specified, settings stay until changed

11.7.6 Floating-Point Numbers; Scientific Notation (`ios::scientific`, `ios::fixed`)

- **`ios::scientific`**
  - forces output of a floating point number in scientific notation:
    - **`1.946000e+009`**

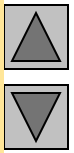
- **`ios::fixed`**
  - forces floating point numbers to display a specific number of digits to the right of the decimal (specified with **`precision`**)

11.7.6 Floating-Point Numbers; Scientific Notation (II)

- **`static`** data member **`ios::floatfield`**
  - contains **`ios::scientific`** and **`ios::fixed`**
  - used similarly to **`ios::adjustfield`** and **`ios::basefield`** in **`setf`**
    - **`cout.setf(ios::scientific, ios::floatfield);`**
  - **`cout.setf(0, ios::floatfield)`** restores default format for outputting floating-point numbers

```
1  // Fig. 11.26: fig11_26.cpp
2  // Displaying floating-point values in system default,
3  // scientific, and fixed formats.
4  #include <iostream>
5
6  using std::cout;
7  using std::endl;
8  using std::ios;
9
10 int main()
11 {
12    double x = .001234567, y = 1.946e9;
13
14    cout << "Displayed in default format:\n"
15         << x << '\t' << y << '\n';
16    cout.setf( ios::scientific, ios::floatfield );
17    cout << "Displayed in scientific format:\n"
18         << x << '\t' << y << '\n';
19    cout.unsetf( ios::scientific );
20    cout << "Displayed in default format after unsetf:\n"
21         << x << '\t' << y << '\n';
22    cout.setf( ios::fixed, ios::floatfield );
23    cout << "Displayed in fixed format:\n"
24         << x << '\t' << y << endl;
25    return 0;
26 }
```

```
Displayed in default format:
0.00123457      1.946e+009
Displayed in scientific format:
1.234567e-003   1.946000e+009
Displayed in default format after unsetf:
0.00123457      1.946e+009
Displayed in fixed format:
0.001235        1946000000.000000
```



Outline

1. Initialize variables

2. Set flags

3. Output

Program Output

11.7.7 Uppercase/Lowercase Control (`ios::uppercase`)

- **`ios::uppercase`**
  - forces uppercase **`E`** to be output with scientific notation

    `4.32E+010`
  - forces uppercase **`X`** to be output with hexadecimal numbers, and causes all letters to be uppercase

    `75BDE`

11.7.8 Setting and Resetting the Format Flags (`flags`, `setiosflags`, `resetiosflags`)

- **`flags`** member function
  - without argument, returns the current settings of the format flags (as a **`long`** value)
  - with a **`long`** argument, sets the format flags as specified
    - returns prior settings
- **`setf`** member function
  - sets the format flags provided in its argument
  - returns the previous flag settings as a **`long`** value

```
long previousFlagSettings =
   cout.setf( ios::showpoint | ios::showpos );
```

11.7.8 Setting and Resetting the Format Flags (`flags`, `setiosflags`, `resetiosflags`) (II)

- **`setf`** with two **`long`** arguments

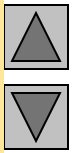
  `cout.setf( ios::left, ios::adjustfield );`

  clears the bits of **`ios::adjustfield`** then sets **`ios::left`**

  - This version of setf can be used with
  - **`ios::basefield (ios::dec, ios::oct, ios::hex)`**
  - **`ios::floatfield (ios::scientific, ios::fixed)`**
  - **`ios::adjustfield (ios::left, ios::right, ios::internal )`**

- **`unsetf`**
  - resets specified flags
  - returns previous settings

```
1  // Fig. 11.28: fig11_28.cpp
2  // Demonstrating the flags member function.
3  #include <iostream>
4
5  using std::cout;
6  using std::endl;
7  using std::ios;
8
9
10 int main()
11 {
12    int i = 1000;
13    double d = 0.0947628;
14
15    cout << "The value of the flags variable is: "
16         << cout.flags()
17         << "\nPrint int and double in original format:\n"
18         << i << '\t' << d << "\n\n";
19    long originalFormat =
20            cout.flags( ios::oct | ios::scient
21    cout << "The value of the flags variable i
22         << cout.flags()
23         << "\nPrint int and double in a new format\n"
24         << "specified using the flags member function:\n"
25         << i << '\t' << d << "\n\n";
26    cout.flags( originalFormat );
27    cout << "The value of the flags variable is: "
28         << cout.flags()
29         << "\nPrint values in original format again:\n"
30         << i << '\t' << d << endl;
31    return 0;
32 }
```



Outline

1. Initialize variables

2. Set flags

3. Output

```
The value of the flags variable is: 0

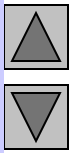
Print int and double in original format:
1750    9.476280e-002

Print int and double in a new format
specified using the flags member function:
1750    9.476280e-002

The value of the flags variable is: 0

Print values in original format again:
1000    0.0947628
```

Notice how **originalFormat** (a **long**) is



Outline

Program Output

```
The value of the flags variable is: 0
Print int and double in original format:
1000    0.0947628

The value of the flags variable is: 4040
Print int and double in a new format
specified using the flags member function:
1750    9.476280e-002

The value of the flags variable is: 0
Print values in original format again:
1000    0.0947628
```

11.8 Stream Error States

- **`eofbit`**
  - set for an input stream after end-of-file encountered
  - **`cin.eof()`** returns **`true`** if end-of-file has been encountered on **`cin`**

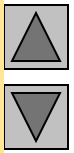
- **`failbit`**
  - set for a stream when a format error occurs
  - **`cin.fail()`** - returns **`true`** if a stream operation has failed
  - normally possible to recover from these errors

11.8 Stream Error States (II)

- **`badbit`**
  - set when an error occurs that results in data loss
  - **`cin.bad()`** returns **`true`** if stream operation failed
  - normally nonrecoverable
- **`goodbit`**
  - set for a stream if neither **`eofbit`**, **`failbit`** or **`badbit`** are set
  - **`cin.good()`** returns **`true`** if the **`bad`**, **`fail`** and **`eof`** functions would all return false.
  - I/O operations should only be performed on “good” streams
- **`rdstate`**
  - returns the state of the stream
  - stream can be tested with a **`switch`** statement that examines all of the state bits
  - easier to use **`eof`**, **`bad`**, **`fail`**, and **`good`** to determine state

11.8 Stream Error States (III)

- **`clear`**
  - used to restore a stream's state to "good"
  - **`cin.clear()`** clears **`cin`** and sets **`goodbit`** for the stream.
  - **`cin.clear( ios::failbit )`** actually sets the **`failbit`**.
    - might do this when encountering a problem with a user-defined type
- Other operators
  - **`operator!`**
    - returns **`true`** if **`badbit`** or **`failbit`** set
  - **`operator void*`**
    - returns **`false`** if **`badbit`** or **`failbit`** set
  - useful for file processing



Outline

1. Initialize variable

2. Function calls

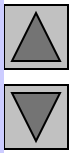
```
1  // Fig. 11.29: fig11_29.cpp
2  // Testing error states.
3  #include <iostream>
4
5  using std::cout;
6  using std::endl;
7  using std::cin;
8
9  int main()
10 {
11    int x;
12    cout << "Before a bad input operation:"
13         << "\ncin.rdstate(): " << cin.rdstate()
14         << "\n    cin.eof(): " << cin.eof()
15         << "\n   cin.fail(): " << cin.fail()
16         << "\n    cin.bad(): " << cin.bad()
17         << "\n   cin.good(): " << cin.good()
18         << "\n\nExpects an integer, but enter a character: ";
19    cin >> x;
20
21    cout << "\nAfter a bad input operation:"
22         << "\ncin.rdstate(): " << cin.rdstate()
23         << "\n    cin.eof(): " << cin.eof()
24         << "\n   cin.fail(): " << cin.fail()
25         << "\n    cin.bad(): " << cin.bad()
26         << "\n   cin.good(): " << cin.good() << "\n\n";
27
28    cin.clear();
29
30    cout << "After cin.clear()"
31         << "\ncin.fail(): " << cin.fail()
32         << "\ncin.good(): " << cin.good() << endl;
33    return 0;
34 }
```

```
Before a bad input operation:
cin.rdstate(): 0
    cin.eof(): 0
   cin.fail(): 0
    cin.bad(): 0
   cin.good(): 1
```

```
Expects an in
```

```
After a bad input operation:
cin.rdstate(): 2
    cin.eof(): 0
   cin.fail(): 1
    cin.bad(): 0
   cin.good(): 0
```

```
After cin.clear()
cin.fail(): 0
cin.good(): 1
```



Outline

Program Output

```
Before a bad input operation:
cin.rdstate(): 0
    cin.eof(): 0
   cin.fail(): 0
    cin.bad(): 0
   cin.good(): 1

Expects an integer, but enter a character: A

After a bad input operation:
cin.rdstate(): 2
    cin.eof(): 0
   cin.fail(): 1
    cin.bad(): 0
   cin.good(): 0

After cin.clear()
cin.fail(): 0
cin.good(): 1
```

11.9 Tying an Output Stream to an Input Stream

- **`tie`** member function
  - synchronize operation of an **`istream`** and an **`ostream`**
  - outputs appear before subsequent inputs
  - automatically done for **`cin`** and **`cout`**
- **`inputStream.tie( &outputStream );`**
  - ties **`inputStream`** to **`outputStream`**
  - **`cin.tie( &cout)`** done automatically
- **`inputStream.tie( 0 );`**
  - unties **`inputStream`** from an output stream
